

Back in 2013 during my Bachelor studies, I started learning Java and Android app development as a hobby and after a whole summer, I managed to make a simple app which worked as a tool box. After a while, I converted the codebase to kotlin and published the app to Google Play store [here](#); Moreover, I'm maintaining it as an open source repository [here](#).

After finishing my Computer Science program, I started as an Android developer intern in [KAR Global](#) company. Over the course of 4 months, I worked on [TradeRev Android app](#) and some of my responsibilities were:

- Cooperating in migration from Android View library to Jetpack Compose.
- Migration from LiveData to SharedFlow/StateFlow API.
- Adding functionality for uploading photos from gallery.
- Migrating DataSources of the app from PositionalDataSource to PagingSource (from paging 2 to paging 3)
- Migrating legacy code's architecture from MVP to MVVM.
- Migration from ButterKnife/Synthetic to ViewBinding library.
- Migrating some legacy Java code to Kotlin.
- Resolving business logic issues/bugs.

I'm currently looking for an opportunity to work as a junior-level native Android developer. In our career, the dead-end is when you stop learning new topics and my priority is to be in a working environment that constantly pushes me towards learning new technologies.

I personally would count "perseverance", "cooperativeness", and "perfectionism" as my greatest strengths in a business environment.
